

Uppie Baby Tutorial

How to quickly connect jupyternotebook/ local project folder to Github

By Elizabeth Shen/Co-authored with AI(Credits to GoogleGemini)

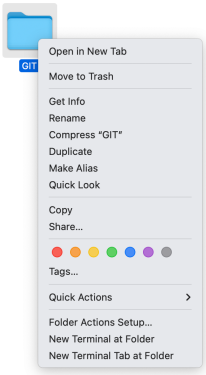

1. **Create or choose one project folder from local computer**

   You can put all files in that project folder or start one file to learn the process

GIT

2. **Open terminal at folder: right click the project folder, then choose New Terminal at Folder**

3. **√🧸Check if all ok**

   1) Type pwd and press Enter. (It should print folder path like /Users/...../GIT).

   2. Type ls and press Enter. (It should list your notebooks).

GITHUB

1. Tell Git Who You Are

Before making a repository, Git needs to know your identity so it can attribute your work to your GitHub account. Run these two commands (replace with your actual info inside the quotes):

git config –global user.name “Your Name”

git config –global user.email your_github_email@example.com

2. Initialize Your Local Repository

Now, initialize your project folder as a Git project and stage your files. Run these commands one by one:

1. Turn the folder into a Git repository

git init

2. Tell Git to track ALL the notebooks in this folder

git add .

3. Save this initial snapshot of your files

git commit -m “Initial commit of my notebooks”

4. Rename your default branch to ‘main’ (GitHub standard)

git branch -M main

code:

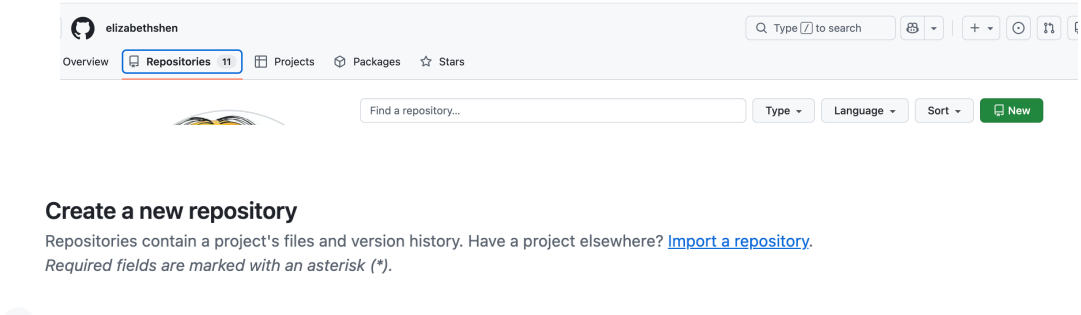

git init

```
git add .
git commit -m "Initial commit of my notebooks"
git branch -M main
```

🧸 After above code, you should able to see a list of your notebooks

3. Create a new repo

1) Click the top menu Repositories, then click New

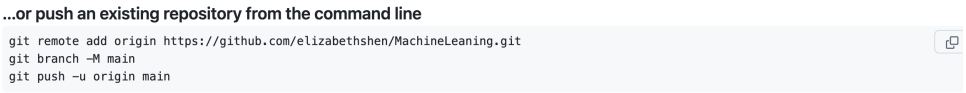

2) Give it a name, but do not check the boxes for a README, .gitignore, or license (since your local folder already has your project files).

3) Click Create repository.

4. Link Your Local Folder to GitHub

GitHub will show you a page with setup commands.
Copy the commands under the section that says *"...or push an existing repository from the command line"*.

For all future updates, you won't need to link it again. You will only need to run:

```
git push
```

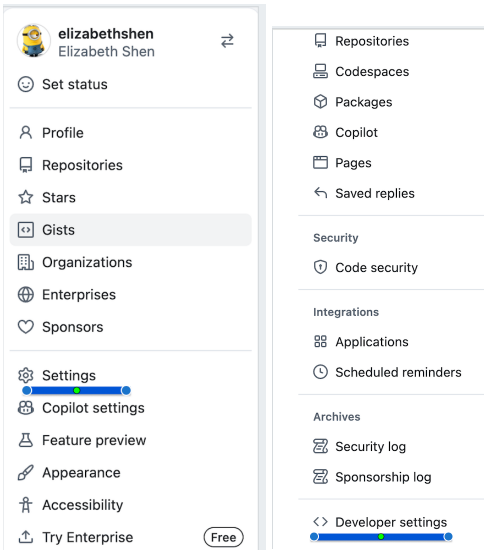

5. Run them in your terminal

 **if ask git username and password, the password is not the normal git password, you need use GitHub Personal Access Token (PAT)** as your password

6. Generate your own git token

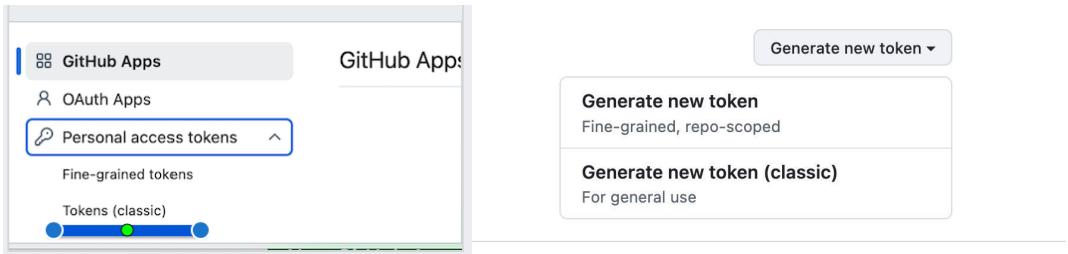

How to Get Your Special Terminal Password (Token)

1. Open **GitHub.com** in your browser, click your **profile picture** (top right), and go to **Settings**.

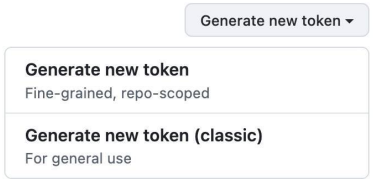

2. Scroll all the way down the left sidebar and click **Developer settings**.

3. Click **Personal access tokens** > **Tokens (classic)**.

4. Click **Generate new token** > **Generate new token (classic)**.

5. Give it a note (like "Mac Terminal").
6. Check the box for `repo` (this allows you to upload code).
7. Scroll to the bottom and click **Generate token**.
8. **Copy the long code** that appears. (Save it somewhere, because GitHub will never show it to you again!).

7. 🧸 **Check! The project files should show at github**

Mission has been accomplished!!!!!

Big Thump up from Uppie!
