How to solve Widget Issues

And display jupyternotebook with outputs in Github

By Elizabeth Shen, co-authored with AI(credits to GeminiGoogle)

What's this???!! Why Github does not want display my dearly Notebook?? It worked before!! What's wrong with it?

Invalid Notebook
ere was an error rendering your Notebook: the
plication/vnd.jupyter.widget-state+json' key is missing from json
Using nbformat v5.10.4 and nbconvert v7.17.1

Invalid Notebook

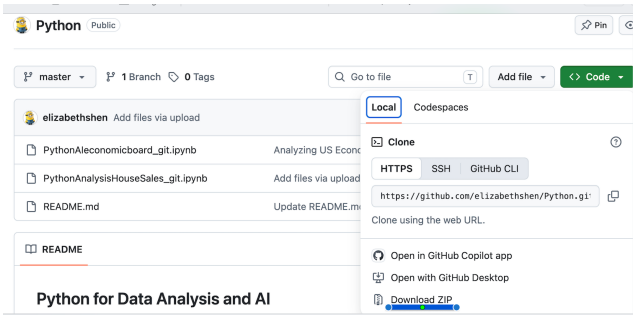

There was an error rendering your Notebook: the
'application/vnd.jupyter.widget-state+json' key is missing from json

Using nbformat v5.10.4 and nbconvert v7.17.1

 Relax, it is just about a widget problem.

 And let's fix it and let your dear notebook shine again in Github, and keep all the outputs also

1. Download the notebook or the whole repo could not displayed to a local computer folder

2. Connect that folder to Github (please refer to my article: How to connect jupyternotebook /local project folder to Github)

Step 1: Remove the widget

1) For a single file

Run this Terminal Command

1. Open your Mac **Terminal** app.
2. Make sure you are inside your project directory (/Users/ /Documents//)
3. Copy and paste this exact command, then hit **Enter**:

```
python3 -c "import json; f='yourfile.ipynb'; d=json.load(open(f)); d['metadata'].pop('widgets', None); json.dump(d, open(f, 'w'), indent=1)"
```

 *Please replace yourfile.ipynb with your real file name*

What this command does:

- It reads the raw JSON structure of your file.
- It safely deletes **only** the hidden "widgets" metadata block.
- It saves the file directly on your hard drive, completely bypassing the browser interface so Jupyter doesn't have a chance to auto-reinject the code.
- **It preserves 100% of your historical query tables and text outputs.**

 Caution: if you remove widgets from metadata , jupyter might auto save it again. That's why we choose to get ride of it via terminal.

2) Remove widgets from all files in the project folders

Copy and paste this exact command, then hit **Enter**:

```
python3 -c "import os, json; [json.dump(d, open(f,'w'), indent=1) for f in os.listdir('.') if f.endswith('.ipynb') for d in [json.load(open(f))] if d.get('metadata', {}).pop('widgets', None) or True]"
```

What this master command does:

1. **Scans the folder:** It instantly looks through your entire directory for any file ending in .ipynb.
2. **Surgically cleans:** It checks inside every single notebook and rips out the broken "widgets" metadata block.
3. **Protects your work:** It saves them all back down instantly, leaving 100% of your historical query outputs untouched across every file.

Step 2: Push it to GitHub

Immediately after running that command, type these three Git commands into your terminal to send the clean version to GitHub:

```
git add .
```

```
git commit -m "Removed widget metadata via terminal to fix preview"
```

```
git push origin main
```

you should able to see your notebook and all outputs.

Mission has been accomplished

Big Thump up from Uppie!
